

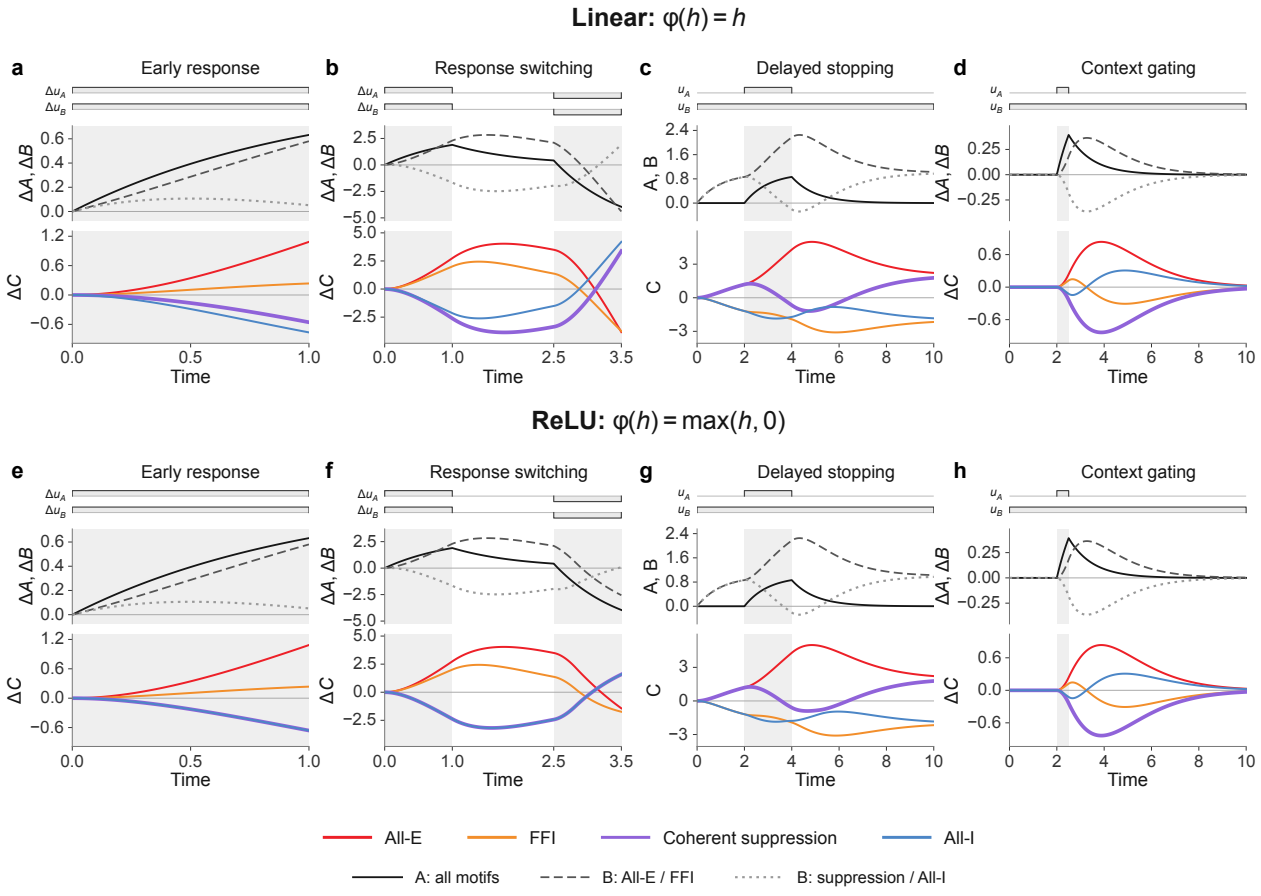

Figure R1 | FFL dynamics with linear and ReLU activations.

a-d, Linear activation; e-h, ReLU activation. Columns show early response, response switching, delayed stopping and context gating, respectively, under matched input protocols and connection weights. Each panel shows schematic inputs to A and B, the A/B trajectories, and the output C. Colours identify All-E, FFI, coherent suppression and All-I motifs; grey line styles distinguish the A/B trajectories as indicated in the legend. States are measured relative to their initial values, except delayed stopping, which shows absolute states from zero initialization. Corresponding axes share the same ranges across activations. Shading marks the input intervals at A.
