

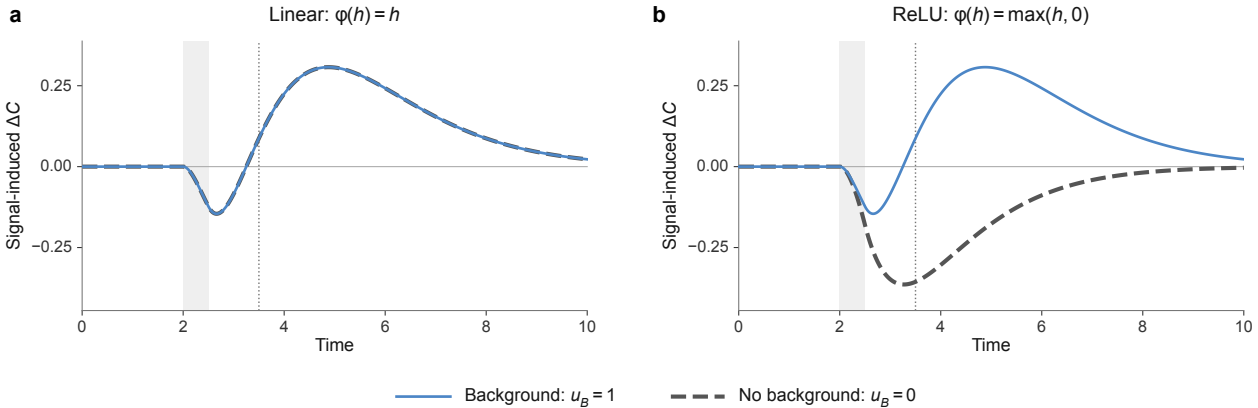

Figure R2 | Background dependence of the All-I signal response.

a,b, All-I FFL responses with linear (a) and ReLU (b) activation under matched inputs and connection weights. Blue solid and grey dashed curves indicate responses with background input to B (u_B = 1) and without background input (u_B = 0), respectively. Signal-induced change in C is computed by subtracting the corresponding no-signal control in each condition. Shading marks the signal at A; the vertical dotted line marks t = 3.5. With linear activation, the two curves overlap. With ReLU activation, the signal produces a positive response with background and a negative response without background at the marked time. Both panels share the same axis ranges.
